SCOPE OF AGRÉMENT

This BDA Agrément® (hereinafter 'Agrément') relates to Ezy Fit Green IWI (hereinafter the 'System'). The System is an internal wall insulation (IWI) System, comprising hemp insulation fitted in-between the timber studs and hemp and jute insulation used as stud backer. The System is for installation in the internal face of external masonry walls, above damp-proof course (hereinafter 'DPC') level on masonry (where masonry includes clay and calcium silicate bricks, concrete blocks, and natural and reconstituted stone blocks) or concrete supporting walls. The System is for existing residential and non-residential buildings.

DESCRIPTION

The System consists of IndiBreathe Flex hemp and jute-based insulation rolls stapled at the back of the timber studs and IndiTherm hemp insulation batts, fitted in between the timber stud frame which is mechanically fixed to the supporting wall.

ILLUSTRATION

THIRD-PARTY ACCEPTANCE

See Section 3.3 (Third-Party Acceptance).

STATEMENT

It is the opinion of Kiwa Ltd. that the System is safe and fit for its intended use, provided it is specified, installed and used in accordance with this Agrément.

Craig Devine
 Operations Manager, Building Products

Alpeo Mlotha CEng FIMMM MBA
 Business Unit Manager, Building Products

SUMMARY OF AGRÉMENT

This document provides independent information to specifiers, specialists, engineers, building control personnel, contractors, installers and other construction industry professionals who are considering the safety and fitness for purpose of the System. This Agrément covers the following:

- Conditions of use;
- Production Control, Quality Management System and the Annual Verification Procedure;
- System components and ancillary items, points of attention for the Specifier and examples of details;
- Installation;
- Independently assessed System characteristics and other information;
- Compliance with national Building Regulations, other regulatory requirements and Third-Party Acceptance, as appropriate;
- Sources.

MAJOR POINTS OF ASSESSMENT

Moisture control - see Section 2.2.7 - the System can be designed to limiting the risk of interstitial and surface condensation.

Fire performance - see Section 2.2.8 - the hemp and hemp and jute insulation elements of the System are classified as European Classification E, in accordance with BS EN 13501-1.

Thermal performance - see Section 2.2.9 - the System improves the thermal performance of external walls and can contribute to satisfying the requirements of the national Building Regulations.

Durability - see Section 2.2.10 - the System shall have a service life durability equivalent to that of the building into which it is incorporated.

UKCA, UKNI and CE marking - see Section 2.2.11 - the manufacturers of the constituent products used within the System have responsibility for conformity marking, in accordance with all relevant British and European Product Standards.

CONTENTS

Section 1 - General considerations

- 1.1 - Conditions of use
- 1.2 - Production Control and Quality Management System
- 1.3 - Annual Verification Procedure - continuous surveillance

Section 2 - Technical assessment

- 2.1 - System components and ancillary items
- 2.2 - Points of attention to the Specifier
- 2.3 - Examples of typical details
- 2.4 - Installation
- 2.5 - Independently assessed System characteristics

Section 3 - CDM, national Building Regulations and Third-Party Acceptance

- 3.1 - The Construction (Design and Management) Regulations 2015 and The Construction (Design and Management) Regulations (Northern Ireland) 2016
- 3.2 - The national Building Regulations
- 3.3 - Third-Party Acceptance

Section 4 - Sources

Section 5 - Amendment history

Section 6 - Conditions of use

1 GENERAL CONSIDERATIONS

1.1 CONDITIONS OF USE

1.1.1 Limitations

This Agrément has been prepared in accordance with the mandatory requirements defined in the relevant Kiwa Technical Requirement. Some information in this Agrément is provided for guidance or reference purposes only; this information falls outside the scope of the Technical Requirement.

1.1.2 Application

The assessment of the System relates to its use in accordance with this Agrément and the Agrément holder's requirements.

1.1.3 Assessment

Kiwa Ltd. has assessed the System in combination with relevant test reports, technical literature, the Agrément holder's quality plan, DoPs and site visit, as appropriate.

1.1.4 Installation supervision

The quality of installation and workmanship shall be controlled by a competent person who shall be an employee of an Approved Installer.

The System shall be installed strictly in accordance with the instructions of the Agrément holder and the requirements of this Agrément.

1.1.5 Geographical scope

The validity of this document is limited to England, Wales, Scotland, Northern Ireland and Ireland, with due regard to Section 3 of this Agrément (CDM, national Building Regulations and Third-Party Acceptance).

1.1.6 Validity

The purpose of this Agrément is to provide well-founded confidence to apply the System within the scope described. The validity of this Agrément is as published on www.kiwa.co.uk/bda.

1.2 PRODUCTION CONTROL AND QUALITY MANAGEMENT SYSTEM

Kiwa Ltd. has conducted an audit of the Agrément holder and determined that they fulfil all their obligations in relation to this Agrément in respect of the System.

The initial audit demonstrated that the Agrément holder has a satisfactory Quality Management System (QMS) and is committed to continuously improving their quality plan. Document control and record-keeping procedures were deemed satisfactory. A detailed Production Quality Specification (PQS) has been compiled to ensure traceability and compliance under the terms of this Agrément.

1.3 ANNUAL VERIFICATION PROCEDURE - CONTINUOUS SURVEILLANCE

To demonstrate that the System conforms with the requirements of the technical specification described in this Agrément, an Annual Verification Procedure has been agreed with the Agrément holder in respect of continuous surveillance and assessment, and auditing of the Agrément holder's QMS.

2 TECHNICAL ASSESSMENT

This Agrément does not constitute a design guide for the System. It is intended only as an assessment of safety and fitness for purpose.

2.1 SYSTEM COMPONENTS AND ANCILLARY ITEMS

2.1.1 Components included within the scope of this Agrément

The components listed in Table 1 below are integral to the use of the System.

Table 1 - Integral components

Component	Description	Dimensions (mm)		
		Length	Width	Thickness
timber studs	timber battens installed to form timber stud frame	2,400	50	100
IndiBreathe Flex	hemp and jute-based insulation rolls used as stud backer, with density of 34 kg/m ³ ($\pm 5\%$), λ_D 0.039 W/mK, manufactured in accordance with EAD 040005-00-1201	1,200	100	40
IndiTherm	hemp insulation batts, with density of 45 kg/m ³ ($\pm 5\%$), λ_D 0.039 W/mK, manufactured in accordance with EAD 040005-00-1201	1,200	570	100

2.1.2 Ancillary items falling outside the scope of this Agrément

The following ancillary items detailed in this Section may be used in conjunction with the System, but fall outside the scope of this Agrément:

- supporting walls - masonry or concrete;
- mechanical fixings for timber studs;
- stainless steel staples;
- VCL;
- plasterboard;
- plasterboard tape;
- sealant;
- cutting and drilling equipment;
- finishes.

2.2 POINTS OF ATTENTION TO THE SPECIFIER

2.2.1 Design

2.2.1.1 Design responsibility

Project-specific design is the responsibility of an Approved Installer, trained and approved by the Agrément holder.

2.2.1.2 Basis of design

The characteristics detailed in the section titled 'Major Points of Assessment' shall be considered during the use of the System.

2.2.1.3 General design considerations

A project-specific design is required. This shall be developed in close co-operation with the Agrément holder.

The Specifier shall determine the suitability of the System to be used on walls in the specific exposure zone detailed in BRE Report 262 on a project-specific basis, with the appropriate local wind-driven rain index, in accordance with BS 8104.

Detailing shall be carried out to a high standard to avoid the ingress of water into the wall construction. The risk of water penetration will cause substantial damage to a wall construction incorporating the System and the thermal benefit of the insulation will be reduced.

Existing external walls shall be structurally sound, in a good state of repair, and free from any damp or mould.

The System shall be installed above DPC level and a minimum of 150 mm above ground level.

Supporting walls incorporating the System shall be detailed to reduce the risk of damage due to movement in the supporting wall, taking into consideration differential movement in dissimilar materials.

Buildings incorporating the System shall be designed and constructed to prevent moisture penetration and air infiltration, in accordance with the relevant Codes and Standards.

Care is needed for design detailing of joints around openings, penetrations and movement joints, in accordance with BS 6093.

Masonry supporting walls shall be vapour permeable to ensure that moisture can escape from inside the building.

A suitable VCL and plasterboard lining shall be fitted on the inner face of the System.

The external supporting wall shall have sufficient strength to withstand all wind, dead and imposed loads that could be applied during installation of the System. The strength and suitability of the supporting wall and the mechanical fixings of the timber studs shall be verified by a suitably qualified engineer.

The project-specific design shall ensure that the System has adequate fixings strength for the attachment to the supporting wall.

2.2.1.4 Project-specific design considerations

The project-specific design shall:

- be determined by the Specifier;
- take into account the requirements of the relevant national Building Regulations - see Section 3.2;
- take into account the service life durability required - see Section 2.2.10.

A pre-installation survey is required to allow determination of the project-specific design - see Section 2.4.1.

The Specifier shall ensure that the following considerations are included in the development of a project-specific design:

- adequacy of supporting wall;
- adequacy of mechanical fixings to fix the timber studs to the supporting wall;
- adequacy of stainless steel staples to fix IndiBreathe Flex at the back of the timber studs;
- thermal transmittance (hereinafter 'U-value') requirements;
- thermal expansion effects of the supporting wall and the System;
- likely local impact resistance.

A WUFI analysis shall be carried out at project-specific design stage, in accordance with BS EN 15026.

2.2.2 Applied building physics (heat, air, moisture)

A Specialist shall check the hygrothermal behaviour of a project-specific design incorporating the System and, if necessary, offer advice on improvements to achieve the final specification. The Specialist can be either a qualified employee of the Agrément holder or a suitably qualified consultant (in which case it is recommended that the Specialist co-operates closely with the Agrément holder).

The checks shall include:

- moisture factors;
- breathability of existing walls;
- existing damp issues;
- degree of wind-driven rain;
- ventilation.

2.2.3 Permitted applications

Only applications designed according to the specifications given in this Agrément are permitted. In each case, the Specifier and Installer shall co-operate closely with the Agrément holder.

2.2.4 Installer competence level

The System shall be installed strictly in accordance with the instructions of the Agrément holder and the requirements of this Agrément.

Installation shall be by an Approved Installer, trained and approved by the Agrément holder.

2.2.5 Delivery, storage and site handling

The System components are delivered in suitable packaging bearing relevant identification information (such as the System name, production identification date or batch number, the Agrément holder's name, etc.) and, where applicable, the BDA Agrément® logo incorporating the number of this Agrément.

Prior to installation, the System components shall be stored in accordance with the Agrément holder's requirements. Good housekeeping protocols shall be followed to avoid damage. When required, particular care shall be taken to:

- avoid exposure to direct sunlight high or low temperatures for extended periods of time;
- store flat and above ground level in a well-ventilated, covered area to protect from rain, frost and humidity;
- store away from possible ignition sources, organic solvents, chemicals and plasticisers;
- store components so as to avoid the edges or corners being crushed;
- protect from mud and dirt.

2.2.6 Maintenance and repair

Once installed, the System requires regular maintenance. For advice in respect of repair, consult the Agrément holder.

Performance factors in relation to the Major Points of Assessment

2.2.7 Moisture control

Condensation risk

External walls incorporating the System can adequately limit the risk of surface and interstitial condensation when designed in accordance with BS EN 15026. Room spaces shall be ventilated in accordance with BS 5250. Care shall be taken to provide adequate trickle ventilation, particularly in rooms expected to experience high humidity.

The risk of condensation occurring will depend upon the effectiveness of the insulation's installation, the internal and external conditions and the properties and vapour resistance of other materials used in the wall construction.

The Specifier shall carry out a condensation risk analysis (CRA) at design stage on a project-specific basis, in accordance with BS 5250 and BS EN 15026, including an assessment of junctions, openings and penetrations.

For Severe (Zone 3) and Very Severe (Zone 4) exposure zones, in accordance with BRE Report 262, the Specifier shall integrate the ventilation strategy for the building into the design and consider wind-driven rain and permeability of existing materials by modelling, using WUFI Analysis.

Resistance to precipitation including wind-driven rain

The project-specific design shall include detailing around openings, penetrations and movement joints to minimise the risk of wind-driven rainwater ingress to the external walls, in accordance with BS 6093.

2.2.8 Fire performance

The IndiBreathe Flex and IndiTherm insulation used in the System are classified as European Classification E, in accordance with BS EN 13501-1.

The fire resistance of walls is based on the occupancy, size and use of a building and shall be a minimum of 30 minutes. It is then specified in 30-minute intervals thereafter. The System shall be covered by a plasterboard lining fixed to battens and with all joints taped, sealed and supported by studs, noggins or battens, to give a minimum 30-minute fire rating.

External walls shall be designed and constructed:

- to adequately resist the passage and penetration of fire;
- so that the unseen spread of fire and smoke with concealed spaces in a wall is inhibited.

In all completed wall constructions, cavity fire barriers shall be provided to comply with the relevant provisions of the national Building Regulations.

For detailed conditions of use regarding requirements for supporting wall fire performance, cavity closers and barriers, fire stopping of service penetrations and combustibility limitations for other materials and components used in the overall wall construction, Specifiers shall refer to the relevant national Building Regulations.

The insulation incorporated in the System shall not be applied over junctions between floors and compartment walls or external walls that are required to provide a minimum period of fire resistance. Care shall be taken to ensure continuity of fire resistance at junctions, around openings and service penetrations with fire-resisting elements, in accordance with the national Building Regulations.

Proximity of flues and appliances

The components of the System shall:

- be suitably separated from any potential source of ignition during installation and once incorporated in an external wall build-up;
- be adequately separated from any heat-producing appliance, fixed combustion appliance, chimney or incinerator flue pipes passing through a wall. Recommended means of separation are detailed in the Approved Documents supporting the national Building Regulations.

2.2.9 Thermal performance

The System can assist in reducing the U-value of external walls. It is essential that detailing is carried out to a high standard to avoid the ingress of water into the insulation layers and to obtain the full thermal benefit from the installation of the System. Any moisture penetration will affect the thermal conductivity.

The requirement for limiting heat loss through the building fabric, including the effect of thermal bridging, can be satisfied if the U-value of a wall incorporating the System does not exceed the maximum U-value requirement given in the national Building Regulations.

The U-value of a completed wall construction will depend on the insulation thickness, fixing method, type of mechanical fixing and the insulating value of the supporting wall and its internal and external finishes.

For the purposes of U-value calculations and to determine if the requirements of national Building Regulations are met, the thermal resistance and U-value of the walls incorporating the System shall be calculated according to BS EN ISO 10211 (taking into consideration BS EN ISO 6946, BS EN ISO 10456 and BRE Report 443), using the declared thermal conductivity (λ_D) values of the insulation materials - see Section 2.5.3. Design and declared thermal values of other building materials can be found in BS EN 10456.

Thermal bridging at junctions and around openings

Care shall be taken in the overall design and construction of junctions with other elements and openings, to minimise cold bridging and air infiltration.

Guidance on linear thermal transmittance, heat flows and surface temperatures can be found in the documents supporting the national Building Regulations and BS EN ISO 10211, BRE Information Paper 1/06, BRE Report 262, BRE Report 497, PAS 2030 and PAS 2035.

2.2.10 Durability

The System shall have a service life durability equivalent to that of the building into which it is incorporated. The expected lifespan of the building itself shall be at least 60 years.

Once installed, the System is not susceptible to damage from environmental conditions normally encountered in the UK and Ireland.

2.2.11 UKCA, UKNI and CE marking

There is no relevant Product standard for the System.

Diagram 1 - Typical detail of IndiTherm insulation installed between timber studs (incorporating 100 mm IndiBreathe Flex on 50 mm wide timber stud)

2.4 INSTALLATION

The System shall be installed strictly in accordance with the instructions (hereinafter 'Installation Manual') of the Agrément holder, the requirements of this Agrément and the requirements of BS 8000-0.

2.4.1 Project-specific installation considerations

The project-specific design shall be determined from a pre-installation survey.

The primary requirement of the pre-installation survey is to determine the following:

- there is no existing rising damp and there are no signs of damp on the inner face of the supporting wall, other than that caused solely by condensation;
- existing walls are:
 - structurally sound, in a good state of repair and show no evidence of rain or frost damage;
 - watertight, clean and meet the requirements of the relevant national Building Regulations;
 - vapour permeable and that all non-vapour permeable coatings have been removed;
- the work area for any existing damage that may require repairs to be inspected;
- insulation areas and required material quantities are confirmed and measured;
- checks for asbestos-containing materials are complete;
- condition of surrounding areas (e.g., floors, walls, ceilings) for suitability are assessed;
- windows are intact with no signs of water leakage.

2.4.2 Preparation

The following considerations apply before starting the work:

- the insulation slabs can be cut using a utility knife, electric rotary cutter or heavy-duty shears;
- studs can be cut using an appropriate tool, such as handsaw, power saw or similar;
- the insulation slabs shall be cut to fit around openings or connections. Any gaps shall be minimised and any exposed cut edges shall be sealed;
- care shall be taken to protect the insulation from damage when handling during installation, until it is fully covered with plasterboard;
- if required, arrangements shall be made for isolating or removing services (gas, electric, water, telephone);
- planning for scaffolding or ladders, ensuring proper safety measures are in place for workers;
- insulation slabs shall not be applied inside electric outlets or junction boxes;
- all ventilation outlets within the external wall shall be preserved, as required, to ensure adequate ventilation into the property is maintained.

The following works shall be undertaken before installing the System:

- carefully remove all existing features such as skirting and plasterboards;
- reroute electrical services away from the wall or make good services to receive the System components.

2.4.3 Outline installation procedure

Detailed installation procedures can be found in the Agrément holder's Installation Manual.

The outline procedure is as follows:

- temporarily mechanically fix timber battens to the wall as required to create a frame with 570 mm horizontal centres and 1,200 mm vertical centres;
- remove the timber frame from the wall;
- cut IndiBreathe Flex stud backer rolls into strips to the required sizes to suit the timber frame;
- staple the IndiBreathe Flex stud backer strips to the back of the timber frame, ensuring full coverage;
- mechanically fix the timber frame to the wall using suitable fixings, such that the IndiBreathe Flex stud backers face the existing supporting wall;
- pressure-fit the IndiTherm hemp insulation batts between the timber studs, ensuring no gaps between the batts and studs;
- where the IndiTherm hemp insulation batts require cutting, they should be cut 10 mm wider than the space they intend to fill.

2.4.4 Finishing

The following finishing is required on completion of the installation (outside the scope of the Agrément)

- install a suitable VCL and plasterboard using appropriate fixings;
- check all flues and ventilation measures for all appliances are not blocked or in any way compromised;
- apply suitable sealant around windows and door frames as appropriate.

Post-installation inspection checks shall be carried out to ensure that the installation has been successfully completed and that the building has not been damaged. These shall be conducted as soon as possible after completion of the work and any defects shall be reported immediately.

2.5 INDEPENDENTLY ASSESSED SYSTEM CHARACTERISTICS

2.5.1 Moisture control

Test	Standard	Result (mean)	
		IndiBreathe Flex	IndiTherm
Water vapour permeability (δ)	BS EN 12086	0.543 mg/(Pa.h.m)	0.573 mg/(Pa.h.m)
water vapour diffusion equivalent air layer thickness (S_d)		0.126 m [^]	0.064 m ^{^^}
Water vapour diffusion resistance factor (μ)		1.313	1.304

[^] for a 100 mm thick specimen

^{^^} for a 40 mm thick specimen

2.5.2 Fire performance

Test	Standard	Result	
		IndiBreathe Flex	IndiTherm
Reaction to fire	BS EN 13501-1	E	

2.5.3 Thermal performance

Test	Standard	Result	
		IndiBreathe Flex [^]	IndiTherm
Thermal conductivity (λ_D)	BS EN 12667	0.039 W/mK	

[^] uncompressed insulation of 40 mm

2.5.5 Other characteristics

Test	Standard	Result	
		IndiBreathe Flex	IndiTherm
Biological resistance - growth of mould fungus	EAD 040005-00-1201 and BS EN ISO 846	No infestation	

3.1 THE CONSTRUCTION (DESIGN AND MANAGEMENT) REGULATIONS 2015 AND THE CONSTRUCTION (DESIGN AND MANAGEMENT) REGULATIONS (NORTHERN IRELAND) 2016

Information in this Agrément may assist the client, principal designer/CDM co-ordinator, designer and contractors to address their obligations under these Regulations.

3.2 THE NATIONAL BUILDING REGULATIONS

In the opinion of Kiwa Ltd., the System, if installed and used in accordance with Section 2 of this Agrément, can satisfy or contribute to satisfying the relevant requirements of the following national Building Regulations.

This Agrément shall not be construed to confer the compliance of any project-specific design with the national Building Regulations.

3.2.1 England

The Building Regulations 2010 and subsequent amendments

- A1 Loading - the System can sustain impact loads and transmit dead loads to the supporting structure
- C2(c) Resistance to moisture - the System can adequately protect the building from interstitial and surface condensation
- C2(c) Resistance to moisture - the System can contribute to limiting the risk of surface and interstitial condensation
- L1(a)(i) Conservation of fuel and power - the System can contribute to limiting heat gains and losses through walls
- Regulation 7(1) Materials and workmanship - the System is manufactured from suitably safe and durable materials for their application, and can be installed to give a satisfactory performance
- Regulation 23 Requirements relating to thermal elements - the System can contribute to walls complying with the requirements of L1(a)(i)

3.2.2 Wales

The Building Regulations 2010 and subsequent amendments

- A1 Loading - the System can sustain impact loads and transmit dead loads to the supporting structure
- C2(c) Resistance to moisture - the System can contribute to limiting the risk of surface and interstitial condensation
- L1(a)(i) Conservation of fuel and power - the System can contribute to limiting heat gains and losses through walls
- Regulation 7(1) Materials and workmanship - the System is manufactured from suitably safe and durable materials for their application, and can be installed to give a satisfactory performance
- Regulation 23 Requirements relating to thermal elements - the System can contribute to walls complying with the requirements of L1(a)(i)

3.2.3 Scotland

The Building (Scotland) Regulations 2004 and subsequent amendments

3.2.3.1 Regulation 8 (1)(2) Durability, workmanship and fitness of materials

- The System is manufactured from acceptable materials and is adequately resistant to deterioration and wear under normal service conditions

3.2.3.2 Regulation 9 Building Standards - Construction

- 1.1 Structure - the System can sustain impact loads and transmit dead loads to the supporting structure
- 3.15 Condensation - the System can contribute to limiting the risk of surface and interstitial condensation
- 6.2 Buildings insulation envelope - the System can contribute to satisfying this Requirement
- 7.1(a)(b) Statement of sustainability - the System can contribute to meeting the relevant Requirements of Regulation 9, Standards 1 to 6, and therefore will contribute to a construction meeting a bronze level of sustainability, as defined in this Standard. In addition, the System can contribute to a construction meeting a higher level of sustainability, as defined in this Standard

3.2.3.3 Regulation 12 Building Standards - Conversions

- All comments given under Regulation 9 also apply to this Regulation, with reference to Schedule 6 of The Building (Scotland) Regulations 2004 and subsequent amendments, clause 0.12 of the Technical Handbook (Domestic) and clause 0.12 of the Technical Handbook (Non-Domestic)

3.2.4 Northern Ireland

The Building Regulations (Northern Ireland) 2012 and subsequent amendments

- 23(1)(a)(i)(iii)(b) Fitness of materials and workmanship - the System is manufactured from suitably safe and durable materials for its application and can be installed to give a satisfactory performance
- 29 Condensation - the System can contribute to limiting the risk of surface and interstitial condensation
- 30 Stability - the System can sustain impact loads and transmit dead loads to the supporting structure
- 39(a)(i) Conservation measures - the System can contribute to satisfying this Requirement
- 40(2) Target carbon dioxide emission rate - a wall incorporating the System must be designed and constructed as not to exceed its target CO₂ emission rate
- 43 Renovation of thermal elements - the renovation work carried out can ensure that external wall complies with Requirement 39(a)(i)

3.2.5 Ireland

Building Regulations 1997 and subsequent amendments

In order to demonstrate compliance with Irish Building Regulations, this BDA Agrément® certifies that the System complies with the requirements of a recognised document and indicates it is suitable for its intended purpose and use.

- A1 Loading - the System can sustain impact loads and transmit dead loads to the supporting structure
- C4 Resistance to weather and ground moisture - walls incorporating the System can contribute to protecting a building from moisture
- D1 Materials and workmanship - the System is manufactured from suitably safe and durable materials for their application
- L1 Conservation of fuel and energy - the System can contribute to limiting heat gains and losses through walls
- L2(a) Conservation of fuel and energy (in existing dwellings) - the System can contribute to limiting heat gains and losses through walls
- L4(a) Conservation of fuel and energy (in existing buildings other than dwellings) - the System can contribute to limiting heat gains and losses through walls
- Regulation 7 Conservation of fuel and energy in existing dwellings - the System can contribute to satisfying this Requirement

3.3 THIRD-PARTY ACCEPTANCE

In the opinion of Kiwa Ltd. if installed, used, and maintained in accordance with this Agrément, this System can satisfy the appropriate structural, fire, moisture, thermal, acoustic and durability requirements of a Structural Warranty provider. Please contact the relevant Structural Warranty provider to ascertain their project specific design requirements and to confirm their acceptance on a case-by-case basis.
